CENTRAL AND WESTERN ANDES

KJELL VON SNEIDERN

INTRODUCTION

The distribution of the birds in Colombia is in great part influenced by the peculiar topographic conditions of the country. The Pacific coast land, located west of the ridge of the Western Andes, is covered by the tall rain forest, meantimes the Caribbean coast offers arid and semi desert vegetation interrupted only in one area by the forest of the Santa Maria Mountains which goes down all the way to the sea level. For this reason the two coast lands offer different birds, many of them not found in other parts of the country.

On the other hand some of the birds found in the tall tropical forest of the areas of the lower Cauca and Magdalena rivers are also found east of the Eastern Andes because the ridge of the Serranía de los Motilones is not high enough to interrupt the connection between the two areas.

But then the Eastern, Central and Western Andes with their high ridges divide the species of birds into different sub-species and many of the birds are isolated to reduced regions. For instance the birds found in the tropical lands located between the Cordilleras are not found up in the temperate and paramo zones of the Andes and viceversa.

Besides this the avifauna found in the areas east of the Eastern Andes, known as the Llanos Orientales and Amazon jungle and which goes well into Venezuela and Brazil is different from the avifauna that lives in other areas of Colombia.

These lists (five of them) have been made with the help of the books "Birds of Colombia" and "Birds of South America" and having the base of my personal investigations.

The five Field Lists are made having in mind the above described divisions of the country's bird life and selecting the regions where roads and hotels offer the visitor a comfortable demurrage.
